

(a) rendering cost is amortized, not paid per environment

RGB

semantic segmentation

Collection gotcha, recorded because it silently mislabels the rare classes that matter most: the idToLabels table grows lazily, so class ids are not stable across invocations –

num_envs= 1: 0=BACKGROUND, 1=UNLABELLED, 2=wall, 3=hazard

num_envs= 4: 0=BACKGROUND, 1=UNLABELLED, 2=wall, 3=agent, 4=hazard

num_envs=16: 0=BACKGROUND, 1=UNLABELLED, 2=agent, 3=wall, 4=hazard

num_envs=64: 0=BACKGROUND, 1=UNLABELLED, 2=wall, 3=hazard, 4=agent

The remap must therefore be recomputed from the table, never cached by id.
